

Layer Picker - Depalletising (e.g. for replenishment of pick fronts)

Today, layer picking is a key element in the logistics chain for volume distributors. The Qubiq Layer Picker® is ideal in systems for both batch layer picking and depalletising by picking and handling whole layers - e.g. for the replenishment of pick fronts.

Depalletising by picking whole layers is the simplest form of Layer Picker application. The Layer Picker® picks up a whole layer from the pallet inserted into the Layer Picker. A stripper plate moves horizontally to receive the layer. The layer is then gently pushed onto the conveyor system, followed by subsequent descrambling to individual consignments. The Layer Picker® even handles layers separated by slip sheets. Finally the individualized items are conveyed to replenish the pick zone or to further sorting and handling.

After being descrambled the individual consignments are aligned for further handling and processing

For more information about the new Layer Picker solutions available from Qubiq please see www.qubiq.com
